USEFUL INSTRUCTIONS

To start, wipe the area around the crack with a clean dry cloth. Remove paper backing from the adhesive at the base of the resin chamber. Position the resin chamber over the crack making sure the damaged area is in the center of the chamber (**see picture A**). Press firmly all around the base of the resin chamber to insure the adhesive is bonded to the glass. Make sure there is no air trapped between the glass and the adhesive. Cut the tip of the resin tube and carefully place 8-10 drops of resin inside the chamber (**see picture B**). With the syringe in the fully closed position place the syringe into the resin chamber and hold it firmly in place. Slowly withdraw the top of the syringes so the plunger is fully extended (**see picture C**) to create a vacuum. Hold the plunger for two minutes. Next pull the plunger from the syringe to equalize the pressure. Re-insert the plunger and depress the top half way (**see picture D**) to pressurize the chamber and force the resin into the crack. Hold the plunger in this position for five minutes or until you see the damaged area filled. Remove the syringe and the resin chamber from the glass by slowly pulling on the tab at the top of the resin chamber. If necessary use the supplied razor blade being careful not to injure yourself. Place the curing film over the repair and expose to direct sunlight for five minutes (**see picture E**). UV resin requires sunlight to cure. After five minutes remove the curing film and scrape the excess resin using the supplied razor blade being careful not to injure yourself. Clean the windshield and properly dispose the used material.
